

Installation

Agad was created with the aim of revolutionizing the decoration of the place and at the same time sound therapy. This production was conceptualized, planned and produced. Like other examples of absorption panel, this panel is made of 100% acoustic monofoam, which is designed and formed to solve the first problems of reflection in the room. You can see an example of a very efficient absorption in a completely optimal product, which we suggest for installation and use in home studios and singing studios.
