

Installation

The amazing Azteka panel is designed to reduce standing waves and prevent them from being filtered, which greatly enhances speech clarity. The performance of this sample starts at 315 Hz and offers effective and uniform absorption up to 3150 Hz. The striking combination of monofoam with polyurethane-coated wood veneer is a unique design aimed at high-performance acoustic audio cores. Other features of this panel are "RT reduction" and "Sweet spot sound field distribution" between the speakers. We recommend that you use this panel in the control room, recording room, home studio, broadcast studio, singing room and drama room.
