

Installation

Deconik microphone isolator has made a revolution in isolator panels. Flexi screen guard is one of these panels, which is the best solution for sound recording in rooms that do not have acoustic treatment. The characteristic of this acoustic panel can be called the high consistency of polyurethane foam which helps to maximize absorption efficiency. This panel produces a clear sound in low and middle frequencies by surrounding the microphone. This acoustic panel has a dual function. The inner surface absorbs the frequency and bass of the singer's voice, while the outer surface of the panel absorbs the reflections scattered around the room. The structure of the acoustic foam has an optimal density and thickness. It provides control of reflections. This Deconic acoustic panel is very easily assembled in the shortest time with the fasteners inside the pack panel around the microphone vertically.
