

Installation

The features of this panel are almost the same as the "wave wood" panel with a slight difference that has significantly changed the function of the panel and separated it from the "wave wood" category. As you can see in the panel image, the number of irregular linear holes has decreased. It is spread at a distance from each other on the surface of the wood, which means that the purpose of this design is to increase the dispersive property in this sample ,Which at medium and high frequencies is also effective in solving echo problems. Another feature of this model is that if installed in the corners, it acts as a bass trap in low frequency control.
