

## Installation

Deconik microphone isolator has made a revolution in isolator panels. VOX GUARD is one of these panels which is the best solution for sound recording in rooms that do not have acoustic treatment. The characteristic of this panel can be called the high consistency of polyurethane foam which helps to maximize the efficiency of absorption. By surrounding the microphone, this panel produces a clear sound in low and middle frequencies. This shield has a dual function. Internally, it absorbs the frequency and bass of the reader's voice, and at the same time, the outer surface of the panel absorbs the reflections scattered around the room. The structure of the acoustic foam has an optimal density and thickness. With the design of the holes, the common mechanism of strengthening the effect of absorption and control. It has provided reflections.
