

Installation

Deconik Sound Absorbing Quad Acoustic Panel, Colored foams especially light-colored foams, oxidize and turn yellow with the passage of time or exposure to sunlight, but now it is an excellent solution to simultaneously ensure the preservation of the appearance and performance of the acoustic panel has been found. This panel has special silver colored aluminum coating surfaces that are not only durable, but also provide the dual function of absorbing and dispersing at the same time, controlling excess energy in a room without compromising its environment. It also performs best in controlling mid and low frequencies and controls excess energy in a room without compromising useful ambient frequencies. The advantage of this feature is to help create a suitable space for listening and hearing a desirable, natural and clear sound. Polyurethane foam with appropriate density (acoustic foam) and aluminum sheet cover with a compressed plastic core in silver color
