

Installation

This panel is one of the sound producers in the Diffusion category with the ability to play and reflect sound and frequencies from all sides of the acoustic panel surface. It is usually used for middle and high frequencies so that the listeners receive a clearer sound. Regarding the structure and raw materials of this panel: the material of this product is completely different from other panels. The primary material of this panel is polystyrene polymer, which is expanded polystyrene or EPS for short, which is commonly known as Unolith. This model helps to understand people's speech and improve their listening due to its different design and material. At last we can mention the simplicity of appearance and proper performance in sound reproduction.
